

Abstract

Pictures and picture backs are improved with the use of an easel back that is fashioned to be a double hook for hanging the picture on a wall. The double loop hanging system described in patent 6,405,466 is improved with the use of this device. The easel flap supports the picture on a surface and allows for the fastening of the picture onto the surface. When it is removed from the picture the easel flap provides a side adjusting means for hanging a picture level on a wall.
